The invention relates to an isolated specific binding member (I) which recognizes an epidermal growth factor receptor (EGFR) epitope which is recognizes an epidermal growth factor receptor (EGFR) epitope which is found in tumourigenic, hyperpoliferative or abnormal cells and not detectable in normal cells. The EGFR epitope is located within the region acid sequence alterations or substitutions. From normal EGFR. (I) is capable of binding the de-7 EGFR at an epitope distinct from the interpretations or substitutions. From normal EGFR. (I) is capable of aberrant expression, or in the absence of amplification of normal wild-type gene. The binding member comprises the VH and VL corpspetide sequence of monoclonal antibody (mAb) 806. (I) is useful for creating or diagnosing human or animal body, especially for treating curreating or diagnosing human or animal body, especially for treating curreating cancer which is located in or adjacent the CFR is measured by contacting a biological sample from a mammal: (I) is also useful for detecting the presence of amplified EGFR, de-7 EGFR with high mannose glycosylation is suspected with (I) under conditions that allow binding the presence of amplified EGFR, from the sample and the antibody, where the CFR to the antibody to occur, and detecting cancer in mammals by detecting the presence or activity of an EGFR with indicates the comprising (I), and optionally webicle, carrier or diluent is useful for detecting cancer in mammals, especially for treating brain-resident cancers that produce aberrantly expressed EGFR in mammals, and malignant mammals, and malignant mammals, and malignant mammals, and malignant constructions agrrowless or requence or activity of merreal tumours in mammals. The present sequence represents the mamble mammals and malignant and malignant is an expected agrrowless the mammals. The presents requence represents the presence or activity of a medicate agrrowlessed EGFR in mammals. The present sequence represents the mamble mammals. The present sequence repr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 GNKLEWMGYISYSGNTRYNPSLKSRISITRDTSKNOFFLQLNSVTIEDTATYYC---VTA 117

                                                                                                                                                                                                                                                                                                                               The sequences given in AAR28670-71 were encoded by plasmids which were used in example to illustrate the production of a human antibody which recognises human interleukin-6 receptor (IL-6R). The antibody which comprises light (L) chain and heavy (H) chain variable regions which were derived from a mouse monoclonal antibody produced from the hybridoma PM1 which contained the plasmids PPM-k3 and pPM-h1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 GNKLEWMGYISYSGITTYNPSLKSRISITRDTSKNQFFLQLNSVTTGDTSTYYCARSLAR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the heavy chain variable region of 5B3 antibody. The cDNA encoding this sequence was obtained from total RNA extracted from a SB3 hybridoma by RT-PCR. 5B3 is an igg1 antibody derived from a TNP-KLH immunised mouse. Its binding to TNP or DNS antigen can be blocked by very low amounts of TNT and it can therefore be used in a method for detecting small assayed explosive molecules. Molecules are detected using a piezoelectric semunoassaying in liquid phase allows stationary and flow analysis of an aqueous sample. The method is sufficiently sensitive for detection of low molecular weight molecules.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MRVLILLWLFTAFPGFLSDVQLQESGPGLVKPSQSLSLTCMVTGYSITSDYAWNWIRQFP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MRVLILLWLFTAFPGILSDVQLQESGPVLVKPSQSLSLTCTVTGYSITSDHAWSWIRQFP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful in the treatment of myocardial infarction, cerebral infarction, acute kidney failure, chronic rheumatism, cardiac shock, parcetaitis, adult respiratory distress syndrome and collitis. The antibodies were generated by immunising Balb/C mice with recombinant human type II phospholipase A2. Spleen cells from the mice were fused with mouse myeloma P3U1 (P3x63Ag8·U1) and the hybridomas obtained were screened for phospholipase A2 inhibitory activity. Active clones were isolated including 12Hs, 1.4 and 10.1. These were cultured and the antibody isolated from the culture supernatoral by precipitation with ammonium sulphate and purification on a column of protein A sepharose CL4B. Because the antibody acts on the primate and mouse forms of enzyme as well as human it is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1; Gaps

The present invention of present invention of the present invention of the present invention of the present invention of the present invention of administration of cisplatin for the treatment of cancer. The method comprises treatment with a monoclonal antibody which inhibits the comprises treatment with a monoclonal antibody which inhibits the phospholipase A2 of human origin), or with a protein or peptide possessing the same inhibitory activity and containing a part of the possessing the same inhibitory activity and containing a part of the apendor mouse type II phospholipase A2, and has the ability to release type II phospholipase A2, and has the ability to release type II phospholipase A2 bound to a cell membrane. Three specific monoclonal antibodies having these properties which can be used are 12H5, 10.1 and 1.4, derived from hybridomas FERM BP-5300, FERM BP-529 and FERM BP-529 respectively. The method can be used for suppressing the nephrotoxicity which is a characteristic feature of cisplatin administration, and therefore allowing more efficient use of the part of an anticancer agent, e.g. by allowing an increased dosage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GNKLEWMGYISYSGITTYNPSLKSRISITRDTSKNQFFLQLNSVTTGDTSTYYCARSLAR 120

The DNA polymerase complementarity determining regions (CDR's) was isolated by polymerase chain reaction. These antibodies recognise human interleukin-6 receptor (II-6R). The mouse hybridoma cells were secretion of these antibodies from the hybridoma cells were (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        65

                                                                                                                                                                    This sequence represents a single chain FV (ScFV) sequence.

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the CDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TWT) method wherein an epitope recognised by an antibody is carried in a fused
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene isolation; membrane-bound protein; fusion protein; drug production; antigen-binding cell; secretable functional protein; antigenic protein; protein isolation; diagnosis; ScFv.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      with low or no antigenic binding activity, for diagnosis, study of, and production of drugs treating abnormal functions of the protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAR29012-15 are portions of monoclonal antobodies which were encoded by plasmids derived from mouse hybridomas. The DNA encoding complementarity determining regions (CDR's) was isolated by polymerase chain reaction. These antibodies recognise human interleukin-6 receptor (IL-6R). The mouse hybridoma cells were secretion of these antibodies from the hybridoma cells were (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the cDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TMT) method wherein an epitope recognised by an antibody is carried in a fused

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the CDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TWT) method wherein an epitope recognised by an antibody is carried in a fused
                                                                                    64
                                                                                                                                      65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gene isolation; membrane-bound protein; fusion protein; drug production; antigen-binding cell; secretable functional protein; antigenic protein; protein isolation; diagnosis; ScFv.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Efficient and selective isolation of a gene encoding membrane protein with low or no antigenic binding activity, for diagnosis, study of, and production of drugs treating abnormal functions of the protein

                                                                                                                                 124
                                                                                                                                                         This sequence represents a single chain Fy (ScFv) sequence. The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the cDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective,
                                                                                     65

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the CDNA. The vector contains DNA encoding a secretable functional protein with antigenity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TMT) method wherein an epitope recognised by an antibody is carried in a fused

                                                                                                      g
                                                                                                                                                                  This sequence represents a single chain Fv (ScFv) sequence.

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the cDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a cDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, the coding sequence of the coding sequence.

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the cDNA. The vector contains DNA encoding a Secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TMT) method wherein an epitope recognised by an antibody is carried in a fused
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gene isolation; membrane-bound protein; fusion protein; drug production; antigen-binding cell; secretable functional protein; antigenic protein; protein isolation; diagnosis; SCFv.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents the heavy chain variable region for monoclonal antibody (MAD) 13D10, which immunoreacts with a lead cation. The sequence was derived from RNA isolated from mouse hybridom cells. The protein can be used for binding heavy metals, such as lead cations. It can be used for detecting, removing, adding or neutralising the heavy metals in biological and inanimate systems. It can be used in e.g. aqueous liquid systems, in biological or environmental systems or in such compositions as perfumes, cosmetics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semi-conductor and integrated circuit components and production materials for electronic components. The products can provide for applications involving minute amounts of
                                                                                                                                                                                                                                                                                                                                                      Monoclonal antibody, Fd fragment, lead cation, perfume, cosmetic, pharmaceutical, health care, skin treatment, pesticide, herbicide, heavy metal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding heavy metal binding polypeptide sequences - used for detecting, removing, adding or neutralising heavy metals, such as lead cations

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
